

Air on the side of comfort.

LG Variable Refrigerant Flow (VRF) systems offer performance for modern comfort. And when paired with the LG MultiSITE™ Connectivity Suite it brings a whole new level of system information, control and choice for multi-unit buildings.

The new intelligent integration provides greater access to the efficiencies of LG VRF technology without sacrificing flexibility, preference or performance. Connectivity Suite was designed to meet the commercial needs of customers in a variety of sectors like hospitality, long-term care, retirement communities and military housing.

LG's collaborative approach with leading suppliers in the hospitality sector has enabled a number of open connectivity solutions, including the first open Zigbee® (HA1.2/Z3.0) wireless integration with the industry-leading LG Multi V™ 5 indoor unit. The dongle provides a wireless solution to compatible third-party thermostats and IoT devices.

We offer multiple wireless and wired solutions with the LG MultiSITE™ Connectivity Suite, including a wired Modbus® option enabling digital information exchange and adjustment of key comfort parameters with Multi V™ 5 indoor units.

Additionally, the Connectivity Suite gives property managers the ability to preset preferences for occupants to maximize the guest experience or control the temperature and humidity of unoccupied rooms for their own cost benefit.

When paired with LG's VRF systems for vertical integration, hoteliers and developers benefit from lower installation cost which is key to the financial viability of retrofit projects.

And when you see your guests and residents feeling relaxed and comfortable, you'll know you made the right choice.
