The LG MultiSITE™ Connectivity Suite

Seamlessly integrate your data stream and manage the indoor environment from a connected device within an existing IP framework.

This new intelligent integration provides greater access to the efficiencies of LG VRF technology without sacrificing flexibility, preference or performance. LG MultiSITE™ Connectivity Suite was designed to meet the commercial needs of customers in a variety of sectors like hospitality and other multi-unit buildings.

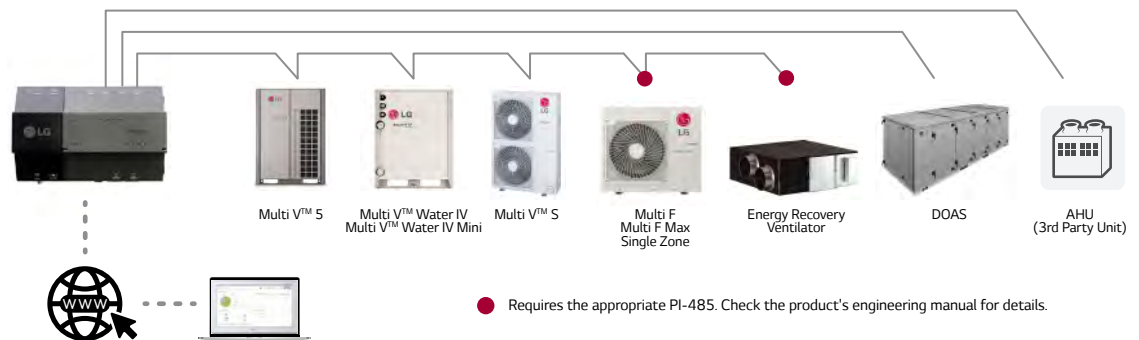

We offer multiple wireless and wired solutions, including a wired Modbus® option enabling digital information exchange and adjustment of key comfort parameters with Multi V™ 5 units.

Stay on top of situations so they don't become larger problems, and track your HVAC performance over time.
